

PRODUCT FORMS AND SPECIFICATIONS

INTRODUCTION

Vegetable growing has become a highly specialized and intensive activity. As a result of the ever increasing demand for better quality, vegetable growers and plant raisers require an improved quality of the propagation material. The demand for specific seed product forms and more information about seed quality has strongly increased to better influence emergence and required number of plants.

Seed is a natural product. The often varying environmental conditions thus influence final results. It is therefore often not possible to give detailed information about emergence and other physical seed characteristics. To meet the wishes of clients as much as possible Bejo has made up quality standards for the various seed categories.

The product specifications are not meant to be absolute minimum standards for delivery. If the quality tests of Bejo indicate a lower quality-level than given in these specifications, Bejo will inform prospective seed users. This communication is aimed at informing professional seed users about the quality they can expect, so they can make their own assessment and decide if these seeds meet their requirements.

The product specifications for both germination and varietal purity of precision seeds and the seed health requirements are based upon Euroseeds recommended standards.

PRODUCT FORMS

All Bejo seed meets the requirements for standard seed of the EU Council Directive 2002/55/EC.

Normal seed

In general, normal seed has not been subjected to special processes. It is sold by weight and/or by count, depending on the product.

Bejo Precision

Bejo Precision is precision seed. The most stringent quality standards are employed for Bejo Precision. The seed has a uniform size and a high germination capacity. The Euroseeds product specifications mentioned in the table below are the basic standards for Bejo Precision.

Primed seed

The priming of seed comprises the activation of the germination process with the aim of ensuring that the seedlings will emerge more quickly and/or more uniformly after sowing. This process may also result in a more uniform crop and enables more accurate timing for pest and weed control.

Pelleted seed

The pelleting of seed is a process in which small or irregularly shaped seeds are coated with an inert material to make them round and uniform, in order to facilitate sowing. It is also possible to add beneficial substances. For pelleted seed only Bejo Precision seed is used.

Bejo organic seed (OS) (yellowish colour coating)

Bejo's organic seed is certified according to Regulation (EU) 2018/848. Bejo applies a yellowish film coating to all organic seed, to facilitate sowing and for better visibility to control the drill depth and sowing rate. Bejo's organic seed coating is approved by the EU organic certifier.

Bejo naturally cleaned and coated (NCC) seed (white colour)

Conventionally produced seed with a white coloured film coating without plant protection products, to facilitate sowing and for better visibility to control the drill depth and sowing rate. Bejo's NCC coating is approved by the EU organic certifier.

Bejo cleaned and coated (CC) seed (green colour)

Conventionally produced seed coated with a green coloured film coating incorporating fungicides. These fungicides protect the seedlings from seedling blight and soil fungi.

Bejo insecticide coating (red colour)

Insecticide coating is a film coating incorporating fungicides and an insecticide. Insecticide coating provides reliable protection at the start of the cultivation. It is only available for some onion varieties and specific countries.

Advice safe use fungicide and/or insecticide treated seed

When using fungicide and/or insecticide treated seed, you must take precautions for your own safety and the protection of the environment. See "Treated seed safe use advice Euroseeds" on our website www.bejo.com.

EUROSEEDS PRODUCT SPECIFICATIONS OF PRECISION SEED AND PELLETS (valid for EU member states)

The germination percentages mentioned are Bejo's minimum required figures and made up according to ISTA methods and tolerances, and are valid at the time of despatch.

Crop		Precision seed	Pellets
Asparagus	germination	85%	
Brassica	germination seed size gradation	90% 0,25 mm	
Beetroot	monogerm multigerm germination germination seed size gradation	80% 90% 0,50 mm	
Bunching Onion	germination seed size gradation	90% 0,25 mm	
Carrot	germination seed size gradation	85% 0,20 mm	
Celery/Celeriac	germination	90%	90%
Chicory Witloof	germination seed size gradation	85% 0,25 mm	85%
Courgette	germination	92%	
Cucumber	germination	92%	

Crop			Precision seed	Pellets
Eggplant		germination	90%	
Endive		germination	90%	92%
Fennel		germination seed size gradation	90% 0,20/0,50 mm	90%
Gherkin		germination	88%	
Leek	OP F1	germination germination seed size gradation	90% 85% 0,20/0,25 mm	90% 85%
Lettuce	Butterhead, Batavia, Iceberg, Romaine other types	germination germination	93% 93%	95% 95%
Melon	Charentais type other types	germination germination	95% 90%	
Onion		germination seed size gradation	90% 0,75 mm	
Radicchio/Green Hearted Chicory		germination	88%	88%
Radish		germination seed size gradation	92% 0,25 mm	
Rooted Parsley		germination seed size gradation	87% 0,20/0,25 mm	87%
Shallot		germination seed size gradation	90% 0,75 mm	
Spinach		germination seed size gradation	85% 0,75 mm	
Sweet/Hot Pepper		germination	90%	
Tomato		germination	92%	
Watermelon	normal type seedless type	germination germination	90% 85%	

EUROSEEDS PRODUCT SPECIFICATIONS FOR VARIETAL PURITY* OF PRECISION SEED (valid for EU member states)

Crop	Minimum % varietal purity for precision seeds
Brassica	93
Courgette	97
Cucumber	99
Gherkin	(excluding pollinators) 98
Eggplant	98
Lettuce Butterhead, Batavia, Iceberg, Romaine	98
other types	95
Melon	98
Pepper	97
Tomato fresh market	98
processing	95
Watermelon	98

* Varietal purity is defined as the percentage of plants from a seed lot that meets the variety description.

SEED HEALTH REQUIREMENTS

In order to supply sufficiently healthy vegetable seeds and in order to meet the requirements of EU Council Directive 2002/55/EC, Bejo uses various disease risk management strategies to prevent and control seed transmitted diseases. These may include and are not limited to seed health testing programs, protected seed production, field inspections, seed treatments and other effective seed disinfection methods.

ISHI-Veg has developed the Manual of Seed Health Testing Methods, which includes state of the art seed health testing protocols. Bejo follows the ISHI-Veg recommended minimum sizes of a representative sample for seed health testing.

Information regarding the ISHI-Veg seed health test protocols and recommended minimum sample sizes can be found at: <https://worldseed.org/our-work/seed-health/ishi-methods/>
